

OpenDataStore (ODS) is a platform that gives true power to open data and offers numerous solutions for empowering smart cities, regions and states to open up towards citizens.

Technology is now present in every part of modern life and the way we perceive cities has changed accordingly. Innovations in IT sector enable us to have a more open communication between citizens and local government, but to see this possibility come true, we need creative software solutions. ODS is based on open data portal with related solutions designed to increase quality of life.

ODS Basic package gives you access to three solutions: ODS DataStage, ODS OpenDataPortal and ODS MyCity, all three carefully designed to make management of modern cities easier and more fun.

Actively including citizens in challenges of city management contributes to building a bond of trust and respect, while decision-making becomes easier. If you have any questions about ODS Basic package, don't hesitate to contact us: info@omega-software.hr

ODS OPENDATAPORTAL & ODS DATASTAGE

ODS OpenDataPortal is a solution for publishing, managing and updating open data (such as locations of schools and kindergartens, meteorological and geolocational data, statistics and financial data). ODS OpenDataPortal is accessible to everyone and very easy to use. Data sets published this way are an open call to creative entrepreneurs to re-use them for building innovative apps. In order to be in compliance with Directive 2003/98/EC and Directive 2013/37/EU and have data sets published in 'machine-readable' format, we created ODS DataStage.

ODS DataStage is a solution that makes the task of publishing data from internal data sources as easy as it gets. It has a very clean and intuitive interface. With simply opening ODS DataStage you get a clear, detailed and accurate insight into gathered data sets, with the possibility of choosing which of those will be published openly. You can publish data sets on government's open data portal or your own.

ODS MYCITY

ODS MyCity is a mobile and web solution (iOS, Android, Windows Phone) used by citizens for reporting irregularities seen around the city. It allows users to mark a location, add photos and short description of what is going on and submit it, asking city administration to deal with the issue. You as the city government have the possibility to give feedback and updates regarding progress of corrections. These submissions are usually blocked sidewalks, illegal dumping, cracked roads etc. ODS MyCity is easy and fun to use, making citizens feel more listened to and involved with city issues.

CITY AS A SERVICE

According to Directive 2003/98/EC and Directive 2013/37/EU, public sector bodies are obligated to make documents containing open data available to public for re-use for commercial and non-commercial purposes. This data must be in 'machine-readable' format and made public through electronic means. In order to make publishing data in such way as easy as possible, we built ODS DataStage solution.

ODS OpenDataPortal and ODS MyCity are intended for taking communication with your citizens to the next level. When presenting ODS OpenDataPortal and ODS MyCity you are sending a message that you are willing to be more efficient, transparent, and ready to consider suggestions on how to make your city better.

ODS is located on Microsoft Azure infrastructure which makes it scalable and always easily accessible.

ABOUT US

Omega Software is a Croatian company founded in 2001. Since the very beginning our core business is development and integration of end-to-end business IT solutions.

Maturity of the team rests on many successful projects, well-versed experts and certificates like quality management system (HRN EN ISO 9001), information security management (HRN ISO/IEC 27001) and records management (ISO 15489-1).

ODS solution is the product of constantly following trends in city management together with related legislature and using our expertise to help you create 'City as a service' model.
